# 1 Introduction

## 1.1 Executive Summary

Primetics, part of Cultura Technologies, is an agri-food technology specialist with a specific focus on seed management and agricultural operations software. Unlike generalist technology providers, our business is centred on agriculture, combining established software products with people who understand seed production, grower contracting, crop operations, field data, pricing, payments, trading, and agricultural supply chain complexity.

Our proposal is built on **Generation**, our mature seed operations and grower contract management platform, which is already used by seed producers and processors around the world. Generation

provides proven back-office capability for grower contract administration, crop and field linkage, pricing, advance payments, remuneration, fixing, quantity commitments, document lookup, reporting, security, audit, configuration, and operational workflows. For Syngenta, we will use this established product capability as the operational backbone, while building the custom web applications, integrations, reporting, and user-facing features required to meet Syngenta's specific Grower Portal requirements.

Syngenta Group's ambition to transform agriculture through locally relevant, data-driven solutions requires a scalable, flexible, and globally deployable digital foundation. In response to this RFP, we propose a Grower Portal solution that combines proven seed management software with tailored web products for both Syngenta users and growers. This approach provides the confidence of an existing agricultural platform while allowing the solution to be configured and extended around Syngenta's countries, crops, remuneration models, pricing processes, data landscape, and phased rollout requirements.

Our solution directly addresses the core project objectives by supporting complex contract and remuneration structures, automated price calculation driven by configurable rules, integration with Syngenta systems such as SAP, field data collection applications and legal contract applications, and external data sources such as commodity pricing feeds. The solution is designed to support high volumes of remuneration models, with categorisation by country, crop, variety, generation, and grower segmentation, and with the flexibility to support annual updates as commercial models evolve.

Although hedging and mark-to-market requirements are often highly specific to each customer's commercial model, we have delivered hedging, fixing, valuation, and mark-to-market capabilities for multiple customers through bespoke configurations and extensions. This experience means we understand the practical complexity of agricultural pricing, contract valuation, market exposure, and customer-specific trading rules, and can apply that knowledge to Syngenta's country-specific requirements.

A key strength of our approach is the combination of a proven operational platform and purpose-built user experiences. Generation will provide the core application and database layer for standing data, transactional data, contracts, pricing, remuneration logic, permissions, auditability, and operational control. Custom grower-facing and Syngenta-facing web applications will provide the tailored digital experience required for this project, supported by secure APIs, document management, ETL capabilities, and data outputs that can be consumed by Syngenta's existing data lake.

From a delivery perspective, the phased implementation model, beginning with the Argentina pilot and scaling progressively across North America, Europe, Brazil, and Asia, reduces risk, validates core functionality and integrations early, and allows user feedback from each phase to shape subsequent rollout activity. It is particularly important given the variation in regional volumes, processes, support needs, and grower populations.

Our organisation brings proven experience delivering agricultural software in complex, data-intensive environments, including seed production and grain trading. We combine technical capability with practical agricultural domain knowledge, ensuring that the solution is not simply a technology implementation, but a business-fit platform aligned to the way agricultural organisations, growers, and processors operate.

**In summary, our proposal delivers:**

- A Grower Portal solution built on an existing seed operations and grower contract management platform
- A strong business and technical fit for Syngenta's grower, contract, crop, pricing, and remuneration requirements
- Custom web products and features tailored to Syngenta users and growers
- Configurable pricing, fixing, hedging, mark-to-market, and remuneration capability aligned to Syngenta's requirements
- Integration with Syngenta's core systems, document management, reporting, and data lake environment
- A scalable phased rollout model supported by agricultural domain expertise and long-term product evolution

This positions Syngenta to enhance grower engagement, improve operational efficiency, increase transparency across contracts and remuneration, and establish a future-ready digital foundation for global seed and grower operations.

## 1.2 Support and Operations

The solution will be supported through a global operating model designed to provide continuity, service quality, and responsiveness across deployed markets.

Services include:

- Global support coverage
- Defined service levels
- Incident, problem, and change management
- Monitoring and performance management
- Release management and enhancement support
- Ongoing operational governance

## 2 Commercial Commentary

### 2.1 Hybrid Price Model

We want to offer Syngenta full clarity on our approach. For your internal system, the Generation deployment, we've proposed a perpetual license with annual maintenance model, this ensures stability and aligns with your long-term back-office infrastructure.

On the other hand, for the Grower Portal, we've embraced a SaaS pricing model, this ensures scalability, flexibility, and smooth global rollout. By combining these models, we meet Syngenta's specific needs: a robust foundation for their existing systems and a flexible, cost-effective solution for their evolving grower engagement. In short, our hybrid commercial approach offers Syngenta the best of both worlds.

Pricing is based on the assumptions, scope, user volumes, regions, integrations, support model, service levels, product roadmap assumptions, and rollout plan described in this proposal. Any material change or further refinement to those items, including a partial award of scope, may require revised pricing, timelines, resourcing, and commercial terms.

Primetics' proposal and all related materials are submitted confidentially and solely for Syngenta's evaluation of Primetics in connection with this RFP. The proposal may not be used for any other purpose. Primetics retains all rights in its proposal materials, pricing methodology, solution design, product information, roadmap, implementation approach, methodologies, know-how, and underlying intellectual property. No ownership rights or licenses are granted except as may be expressly agreed in a definitive written agreement signed by the parties.

## 2.2 Client References

We're pleased to provide the three client references who can attest to our capabilities on projects similar in scale and complexity to Syngenta's needs. We'll gladly provide their full contact details so you can hear directly about their experience with us.

## 2.3 Commercial and Contractual Assumptions

Primetics' proposal is submitted for evaluation purposes only and remains subject to negotiation and execution of mutually acceptable definitive agreements. Primetics has not yet been provided with Syngenta's proposed contractual terms and conditions and therefore reserves all rights to review, comment on, and negotiate those terms before entering into a binding contract.

Nothing in Primetics' proposal should be interpreted as acceptance of Syngenta's standard terms, any future contractual terms, or any RFP requirement inconsistent with the assumptions below.

1. **Contract terms.** Any engagement will be subject to mutually agreed SaaS, implementation, support, SLA, data processing, security, and related contractual terms.
2. **IP ownership.** Primetics will retain all rights in its platform, software, tools, methodologies, know-how, templates, configurations, product architecture, roadmap, pre-existing IP, and reusable developments. No Primetics IP will transfer to Syngenta.
3. **Scope and change control.** Final pricing, timelines, implementation obligations, service levels, and support commitments depend on the final agreed scope, requirements, integrations, data flows, rollout plan, user volumes, and Syngenta dependencies. Any material change should be handled through agreed change control.
4. **Data dependencies.** Primetics is not responsible for inaccurate, incomplete, delayed, unavailable, or unvalidated data from Syngenta systems, third-party systems, external commodity sources, or other upstream data sources.
5. **Liability.** Any liability, indemnity, service credits, remedies, or other financial exposure must be proportionate to the project, subject to agreed exclusions, and capped under the final contract.
6. **Support and SLAs.** Support obligations, service levels, response times, local/regional support, language coverage, and escalation procedures will be subject to mutually agreed terms and appropriate fees.

7. **Data protection and security.** Any data protection, privacy, cybersecurity, audit, hosting, subprocessors, and cross-border transfer requirements will need to be reviewed and agreed as part of the final contract.

## 3 Capabilities and Roadmap

### 3.1 Current Capabilities / Initial Pilot Enhancements

The proposed product suite provides the core capabilities required to establish the initial Grower Portal pilot and support early deployment. Current capabilities include:

- Hosted Progress OpenEdge application and database platform (Generation)
- Grower-facing web portal
- Separate internal web portal for Syngenta users
- Central management of standing data, transactional data, and user permissions
- Configurable contract and remuneration model management
- Rules-based pricing engine
- Bulk creation and update functionality
- Document Management Solution for controlled document exposure
- Data extraction and transformation capability
- Standard dashboards and reporting
- API-led integration framework for enterprise and external systems

During the initial pilot phase, these capabilities will be configured and enhanced in line with Syngenta's priority use cases, target countries, integration requirements, and user feedback.

### 3.2 Longer Term Vision

Following the initial pilot, the roadmap will be guided by Syngenta user feedback, business priorities, rollout learnings, and agreed governance. Future enhancements may include expanded pricing and hedging functionality, improved grower and Syngenta user workflows, enhanced document controls, broader ETL and data lake enablement, advanced analytics, increased automation, improved global rollout templates, and deeper integration with Syngenta's digital agriculture ecosystem.

The longer-term vision is to progressively evolve the solution into a scalable global platform that supports more advanced decision-making, operational efficiency, grower transparency, and future digital agriculture capabilities, while ensuring roadmap priorities remain aligned with the needs of Syngenta users and growers.
